

What you still have to do

Alsaiti Growth — everything that needs **you**, in person. Nothing on this list can be done for you.

The short version

The website is **live and working**. It captures enquiries, stores them safely, and returns a reference number. Security is proven, not assumed. **One thing is broken:** nobody gets emailed when an enquiry arrives. Task 1 fixes that and takes about half an hour. Tasks 2 and 3 are good practice, not emergencies.

Task	Why it matters	Time	Urgency
1. Email provider (Resend)	Until this is done you are not told when a lead arrives	~30 min	Do today
2. Uptime monitor	Tells you if the site breaks, before a client does	~10 min	This week
3. Decide on the old demo login	A leftover account from the previous tool	~2 min	Whenever

Never send a key or password in chat

When a provider shows you an API key, paste it straight into the terminal command in this document. Do not paste it into a chat message, a screenshot, an email, or this file. Anything pasted into a chat should be treated as compromised and rotated at the provider.

What is wrong right now. Someone fills in your contact form. It is saved correctly and they get a reference number — nothing is lost. But no email goes to you, because the system has no email provider connected. For a lead-generation business that is the one failure that actually costs money, so this is the task to do first.

Good news: enquiries that arrive before you finish this are *not* lost. They wait in a queue and send themselves automatically within a minute of you finishing Step 4.

Step 1 — Create the Resend account

- ☐ Go to **resend.com** and sign up (the free tier is enough to start).
- ☐ Open **Domains** → **Add Domain**.
- ☐ Enter exactly: **send.alsaitigrowth.com**

Resend will now show you a list of DNS records. Leave that page open.

Step 2 — Copy those records into Cloudflare

- ☐ In a second tab open **Cloudflare** → your account → **alsaitigrowth.com** → **DNS**.
- ☐ For each row Resend shows, click **Add record** in Cloudflare and copy Type, Name and Value **exactly**.
- ☐ Set **Proxy status** to **DNS only** (grey cloud, not orange) on every one of them.
- ☐ Go back to Resend and press **Verify**. It usually goes green in a few minutes.

The DKIM record is the one people get wrong

It is a long string and it is **unique to your account** — nobody, including me, can give it to you. Copy it from your own Resend page with the copy button rather than retyping it. If Resend will not verify, it is almost always this record, or an orange cloud that should be grey.

Step 3 — Create the API key

- ☐ In Resend open **API Keys** → **Create API Key**. Permission: **Sending access**.
- ☐ Copy it. It starts with **re_** and is shown **once** — if you lose it, just make another.

Step 4 — Give the key to your backend

Open a terminal in your project folder and run this, pasting your real key in place of the placeholder:

```
supabase secrets set RESEND_API_KEY=re_your_real_key_here
```

How you know it worked. Run this — it should say **ok** instead of **degraded**:

```
curl -X POST https://hedaklvumeihfsgokdsi.supabase.co/functions/v1/health -H "Content-Type: application/json" -d "{}"
```

Then send yourself a test enquiry through the form on alsaitigrowth.com and confirm the email actually lands. Check spam the first time.

2

Put an uptime monitor on the site

~10 min
you only

The system already reports its own health honestly. What is missing is something watching it, so you find out the site is down from an alert rather than from a client asking why nobody called them back.

- ☐ Sign up at **uptimerobot.com** (free) or **betterstack.com**.
- ☐ Add an **HTTP(S)** monitor for **https://alsaitigrowth.com** — every 5 minutes.
- ☐ Add a second monitor for the health endpoint below, and set it to alert on any status other than 200.
- ☐ Put your own email and phone in as the alert contact, and test that the alert reaches you.

```
https://hedaklvumeihfsgokdsi.supabase.co/functions/v1/health
```

Why the second one matters: the site can look perfectly fine while the database or the lead queue behind it is failing. The health endpoint returns 503 when that happens; the homepage would still return 200.

3

Decide what to do with the old demo login

~2 min
your call

There is one account left over from the tool that built the earlier version of the site:

founder+demo@alsaitigrowth.com, created 5 July 2026 and not used since. I have repaired it so it works properly if you sign in, but I deliberately did **not** delete it — deleting somebody's login cannot be undone, and whether you still want it is your decision, not mine.

- ☐ If you want it gone: Supabase → **Authentication** → **Users** → find it → **Delete user**.
- ☐ If you want to keep it as a demo account: set a fresh password on it, and never use it with real client data.

Already done — you can stop thinking about these

Every line below was checked against the live system, not assumed from the code.

- ✓ **Website live on your domain**
alsaitigrowth.com serves the current build from Cloudflare, pointed at your own Supabase project.
- ✓ **Contact form works end to end**
Submitted the real form in a browser: returned reference AG-E5154512, and that exact row was in the database with its tracking id. Test rows deleted afterwards.
- ✓ **No client can see another client's data**
Proven with two real logins, not by reading the rules: 15 out of 15 checks passed. Account B could not list, open, filter, edit, insert or delete anything belonging to account A.
- ✓ **Nothing leaks to the public**
All 40 database tables were requested using only the public key that ships in the browser. Not one returned a single row.
- ✓ **Lead alerts cannot be silently lost**
Enquiries queue durably and retry. A bug that binned them permanently when the email key was missing was found and fixed.
- ✓ **The system runs itself**
The lead queue drains every minute and old data is deleted nightly at 03:15 — both confirmed running on the live database, not just scheduled.
- ✓ **Security headers and bot protection**
Full header set live. A policy that was silently blocking Cloudflare's own bot detection was found and fixed.
- ✓ **The product does not lie to clients**
Every simulated screen says so plainly, and the Terms define what 'Demo' means. Nothing claims a live call, a real integration or a real statistic that is actually a mock.
- ✓ **No false promises in the small print**
The only mention of 'unlimited' says voice is *not* unlimited; the only 'guarantee' says results are not guaranteed.
- ✓ **Mobile app on the right project**
The Expo app points at your current database. The old project reference appears nowhere in the code.
- ✓ **Tests and secret scanning**
14 of 14 test suites pass, repo audit clean, no credentials in the code or in git history.

What this does *not* cover

So you are never caught out in front of a client: the **AI receptionist, phone numbers and the integrations screens are demonstrations**, and the site says so. They show a client exactly how the product behaves, but no real call is answered and no real CRM is connected yet. Making those genuinely live needs a funded Telnyx account, voice hosting, and each integration built and approved one at a time — that is weeks of work, not an afternoon, and none of it is on this list.

Sell what works. Today you can honestly promise: enquiries captured from your website, stored safely, kept separate per client, and emailed to you the moment they arrive — once Task 1 is done.

If something breaks and you need to explain it

Two things answer almost any question. The health endpoint in Task 2 tells you whether the backend is healthy. And every enquiry has a reference like **AG-E5154512** — quote that and the exact record can be found in seconds.
