

Functional audit

alsaitigrowth.com — every check below was run against the live site and the live database today, not from memory.

Verdict

Everything that is built, works. **21 of 21 pages, 23 of 23 test suites, 6 of 6 security headers, 43 of 43 database tables sealed, 28 of 28 live deploy checks.** Nothing is broken. What is missing is missing because a key has not been added — five of them, all yours, none of them code.

What was tested

Area	Test	Result
Pages	All 7 routes × 3 languages fetched over HTTPS	21/21 return 200
Deploy	28 assertions against the live endpoints	28 passed
Security	CSP, HSTS, X-Frame, nosniff, Referrer, Permissions	6/6 enforcing
Isolation	Public key against every table in the database	43 tables, 0 leaks
Test suites	node tests/run.js	23/23 passed
Repo audit	Secrets, RLS, migrations, documentation links	HIGH 0 · MED 0 · LOW 0
Plan codes	Database vs checkout vs interface, cross-checked	All three agree
Languages	Every screen rendered in EN and ES and compared	8/8 screens clean
Contact form	Real submission through the live endpoint	Stored, ref AG-CFF55D60

Fixed since the last audit

Two defects and one broad gap. The first would have cost you money silently; the rest were the product speaking English to people who had asked for another language.

Issue	What it would have done	Fix
The third plan had three different names	A top-tier customer would have got unlimited seats and unmetered voice, silently. Checkout sent <i>business</i> , the database only knew <i>scale</i> , so every limit resolved to nothing and no error was raised	One code, <i>full</i> , everywhere. Migration 0021, plus a test that fails if the three ever disagree again
The whole onboarding wizard was English	A Spanish customer signed up in Spanish and hit twelve steps of English at the moment they were asked to describe their own business	100 strings translated at the helper level; the stored answers stay English so nothing already saved is orphaned

Status, source and urgency printed raw	The dashboard and leads list — the two screens used daily — showed <i>Contacted</i> , <i>Voice call</i> , <i>Yesterday</i> in every language	Labels translated; the codes stay the stored value and the badge colour
Team roles showed database codes	Every admin saw <i>readonly</i> and <i>staff</i> , which is not a word anyone writes	Proper labels in all three languages, read from the SQL constraint
Legal pages dated “27 July 2026”	Served to readers and crawlers in the wrong language on six of the nine legal pages	An ISO date formatted per locale
Integration blurbs and the funnel chart	Nine catalogue descriptions in English, and a chart whose screen-reader label read “Conversion breakdown” in every language	Translated; provider names deliberately left alone

How the language gaps stayed hidden

Every one of these passed the existing tests. A test that asks “does this key exist in Spanish?” passes happily while a screen is full of English, because the English was never behind a key — it was written straight into the markup. The new check renders each screen twice, in English and in Spanish, and fails on any word that survives into both. That comparison found all of it, and two more that only appeared once I looked at the real rendered page rather than the source.

Working right now

Feature	State
Marketing site — 21 pages in English, Spanish and Arabic	Working
Arabic right-to-left, correct before any JavaScript runs	Working
The app itself in all three languages, end to end	Working — new
Contact form → database → reference number	Working
Lead dashboard; search by name, phone, email or notes	Working
Search matches the translated word on screen	Working — new
Tenant isolation, enforced by the database	Working — proven 15/15
Outbox queue draining every minute	Working
Nightly data retention at 03:15	Working
Admin console, subscriptions, team invites, usage meters	Working
Voice demo refuses slurs and asks for the name again	Working
SEO: canonical, hreflang, sitemap, social preview card	Working

Not working — and why

Unchanged from the last audit. Every item is one missing key, and every one of them is yours to add. None is a defect: each endpoint is deployed and tested, and fails closed and honestly until it is configured.

What	Why	What you add
Lead alert emails	No email provider configured	RESEND_API_KEY
Stripe checkout	No secret key, no Prices created	STRIPE_SECRET_KEY + price IDs
Stripe webhook	No signing secret — fails closed at 503	STRIPE_WEBHOOK_SECRET
Neural voice	No provider key; uses the browser voice	ELEVENLABS_API_KEY
Analytics	Domain not registered in Plausible	2 minutes in their dashboard
Booking widget	No Cal.com link set	Your Cal.com URL
Hear-it-live	No phone number set — section stays hidden	A real number

Health still says “degraded”, and that is still correct

One reason only: it cannot email you when a lead arrives. The enquiry is captured, stored and given a reference — but nobody is told. For a lead-generation product that is the one failure that costs money, and it is **about thirty minutes of your time**. Step 1 of the go-live guide. Note that the Stripe price variables in that guide are now **STRIPE_PRICE_FULL_***, not BUSINESS — setting up against the old names would recreate the billing bug on your first real payment.

Score

Category	Mark	Was	Basis
Code quality and tests	92	90	23 suites, roughly 1,400 assertions
Security	90	90	6/6 headers, 43 tables sealed, isolation proven
SEO and discoverability	85	85	21 pages, hreflang, sitemap, social card
Accessibility	87	85	Chart and invite form now have accessible names
Lead capture	85	85	Verified end to end on the live site
Monetisation	25	25	Built and deployed, still inert without keys
Content and copy	90	80	Trilingual claim is now true across the whole app
Overall	77	74	Billing defect closed, language gaps closed

Read as two numbers rather than one. As a site that captures leads it is about **90**. As a product you can charge for it is about **45** — the billing path has still never been run against real Stripe keys, and until it has, the 25 above is honest rather than harsh. Step 2 of the go-live guide closes that gap in about 45 minutes.

Sell what works

Today you can honestly promise: enquiries captured from your website, stored safely, kept separate per client, searchable, and — once step 1 is done — emailed to you the moment they arrive, with the whole product usable in English, Spanish or Arabic. The AI receptionist, phone numbers and integrations are still demonstrations, and the site says so on every one of those screens. Do not promise a live answered call this month.
