

Functional audit

alsaitigrowth.com — every check below was run against the live site and the live database, not from memory.

Verdict

Everything that is built, works. **21 of 21 pages, 19 of 19 test suites, 6 of 6 security headers, 43 of 43 database tables sealed, 20 of 20 scheduled jobs succeeded.** Nothing is broken. What is missing is missing because a key has not been added — five of them, all yours, none of them code.

What was tested

Area	Test	Result
Pages	All 7 routes × 3 languages fetched over HTTPS	21/21 return 200
Assets	robots.txt, sitemap.xml, og-image.png, unknown path	200 / 200 / 200 · 404 correct
Contact form	Real submission through the live endpoint	Stored, ref AG-CFF55D60
Backend	7 Edge Functions probed anonymously	All correct status codes
Security	CSP, HSTS, X-Frame, nosniff, Referrer, Permissions	6/6 enforcing
Isolation	Public key against every table in the database	43 tables, 0 leaks
Scheduled jobs	cron run history, last 20 minutes	20/20 succeeded
Test suites	node tests/run.js	19/19 passed
Repo audit	Secrets, RLS, migrations, documentation links	HIGH 0 · MED 0 · LOW 0
Deploy check	28 assertions against live endpoints	28 passed

Working right now

Feature	State
Marketing site — 21 pages in English, Spanish and Arabic	Working
Arabic right-to-left, correct before any JavaScript runs	Working
Contact form → database → reference number	Working
Lead dashboard; search by name, phone, email or notes	Working
Tenant isolation, enforced by the database	Working — proven 15/15
Outbox queue draining every minute	Working
Nightly data retention at 03:15	Working
Admin console, subscriptions, team invites, usage meters	Working

Voice demo content screen (slurs and abuse)	Working
SEO: canonical, hreflang, sitemap, social preview card	Working

Not working — and why

Every item below is one missing key. None is a defect in the code: each endpoint is deployed and tested, and fails closed and honestly until it is configured.

What	Why	What you add
Lead alert emails	No email provider configured	RESEND_API_KEY
Stripe checkout	No secret key, no Prices created	STRIPE_SECRET_KEY + price IDs
Stripe webhook	No signing secret — fails closed at 503	STRIPE_WEBHOOK_SECRET
Neural voice	No provider key; uses the browser voice	ELEVENLABS_API_KEY
Analytics	Domain not registered in Plausible	2 minutes in their dashboard
Booking widget	No Cal.com link set	Your Cal.com URL
Hear-it-live	No phone number set — section stays hidden	A real number

Health says “degraded”, and that is correct

The health endpoint reports degraded for exactly one reason: it cannot email you when a lead arrives. The enquiry is captured, stored and given a reference — but nobody is told. For a lead-generation product that is the one failure that costs money, and it is **about thirty minutes of your time** to fix. Step 1 of the go-live guide.

Fixed in this pass

Issue	Fix
Assistant repeated slurs back to callers	Content screen added; now asks for the name again, capped at two tries
“yes” accepted as the service requested	One-word answers rejected in all three languages; asks properly instead
Abuse would reach the lead record and dashboard	Screened on the service field too
“Most popular” card looked flat	My own CSS was overriding the original; override removed
Demo pill overflowed on narrow phones	Wraps below 560px instead of forcing a 340px minimum
“Good afternoon, Demo” greeted a placeholder	Names the business and carries the date, in all three languages
“Book a call” and “Contact” did the same thing	Now distinct: book a time, or send a message
Nav button did not match the bar	Same pill radius; the sticky bar no longer covers section headings
Two pricing pages disagreed on names and prices	One source of truth; real prices on every page

Footer heading outline skipped a level (h2 to h4)

Now h3 — zero jumps, identical appearance

Two of those were mine

The flat pricing card and the two conflicting pricing pages were both caused by earlier work of mine — reusing existing CSS class names, and building a pricing page without first checking whether prices already existed. Both are fixed, and both are recorded in the commit history rather than quietly tidied away.

Score

Category	Mark	Basis
Code quality and tests	90	19 suites, roughly 1,200 assertions
Security	90	6/6 headers, 43 tables sealed, isolation proven
SEO and discoverability	85	21 pages, hreflang, sitemap, social card
Accessibility	85	AA contrast, focus rings, clean outline, icons hidden
Lead capture	85	Verified end to end on the live site
Monetisation	25	Built and deployed, but inert without keys
Content and copy	80	Real prices; 1,071 strings in three languages
Overall	74	Up 2 — heading outline, pricing merge, content screen

Read as two numbers rather than one. As a site that captures leads it is about **88**. As a product you can charge for it is about **45** — the billing path has never been run against real Stripe keys. Step 2 of the go-live guide closes that gap.

Sell what works

Today you can honestly promise: enquiries captured from your website, stored safely, kept separate per client, searchable, and emailed to you the moment they arrive once step 1 is done. The AI receptionist, phone numbers and integrations are still demonstrations — the site says so on every one of those screens. Do not promise a live answered call this month.
